

Executive Support System

Functionality Brief

The Executive Support System functionality in MEDITECH's General Accounting solution makes accessing and viewing organization-wide information practically effortless. The system offers hospital executives and department managers from across your healthcare organization a powerful management tool to gather and analyze information throughout your healthcare network. It produces user-defined reports instantaneously, enabling decision makers at all levels to view integrated financial, clinical, and statistical information from all departments, facilities, and corporations.

Highlights:

- Compile information from across your organization into summary and detail views
- Define access for multiple levels of users
- View and trend historical information
- Create standard and individualized reports
- Compare data and period analysis reports
- Drill down into reports to view additional details

The Executive Support System Enables your Executives and Managers to: **View Network-wide Information**

The Executive Support System collects and displays financial and statistical information residing in MEDITECH's EHR. Screen displays or printouts may include information from a single department or present information from multiple departments throughout your healthcare organization.

Furthermore, to share data system-wide, information not already resident on the MEDITECH system may be entered and compared with existing data to assist in budgeting and other decision-making analysis.

Access Department-specific Information

Facility administrators, department managers, and supervisors have the ability to access information specific to their locations or departments using the Executive Support System. For example, department managers with the proper security clearance can view General Ledger, Materials Management, and Payroll information for their departments without waiting for printed reports. They can then use this financial and statistical data to better manage their specific departments, such as Laboratory, Pharmacy, and Purchasing.

Use Standard and Customized Views

The Executive Support System lists data fields from MEDITECH's EHR in a "view" format. Based on security clearance, your staff can access both standard and individualized views by simply identifying the categories of information they want on a particular view. The Executive Support System then automatically displays the data in tabular and graphical format and draws attention to spikes and valleys.

Executives and managers have several options available for creating their own customized views, including:

- Standard fields
- User-defined fields
- Calculated fields
- Reporting of external data.

Gather and Analyze Data Using History, Time Slice, and Selection Options

The Executive Support System includes a number of features for gathering and analyzing information at various summary levels and across different time periods. Depending upon the specific application, data is captured on either a daily or period basis. Once in the view, staff has several options for changing the display or breakdown of data. For example, staff can change the time scale on a view to quarterly, fiscal year, or fiscal YTD, or select their own date range. Additionally, staff and managers have the ability to drill down into information to view specific details, such as actual versus budgeted General Ledger expenses. This promotes greater fiscal responsibility and accountability.

Staff can compare information from a current time period against data from prior periods. The net and percent change in data values between the two columns is calculated and displayed for all the data fields on the view. Viewed data can also be temporarily or permanently limited. This is particularly useful to decision makers who need or want to only view information from certain areas of your organization.

Reap the Benefits of Integration

The Executive Support System updates automatically by searching the MEDITECH EHR and pulling forward the latest statistical information from the following applications:

- Health Information Management
- Patient Care and Patient Safety
- Enterprise Medical Record (Order Management)
- Pharmacy
- Laboratory and Microbiology
- Revenue Cycle
- General Accounting
- Supply Chain Management
- Medical and Practice Management.
